

What is Zapier?

Zapier is a no-code automation and integration platform that connects different apps and makes them work together automatically.

Instead of manually moving information between apps, Zapier watches for an event in one app and performs actions in other apps.

Zapier is best when you want to connect many existing business applications quickly, with minimal technical work.

A Zap consists of a **Trigger** + **one or more Actions**.

Simple example

That's a **Zap**.

- Zapier is basically a bridge between your business applications.
- 9,000+ apps
- Specially for Non-technical

A marketing person, HR person, salesperson, or operations manager can build automation without being a programmer.

For example:

"Whenever someone submits our website form, add them to HubSpot and send them an email."

They can build that visually.

Zapier is explicitly designed around no-/low-code workflows and managed app connections.

Every day you complete in this internship is another building block in your AI career. Stay curious, stay consistent, and remember: the future belongs to those who keep learning. See you tomorrow don't break the streak!

Choose Zapier when:

"I want to connect existing business apps quickly."

Choose n8n when:

"I need deep customization and technical control."

Important comparison

n8n	Zapier
Workflow	Zap
Trigger Node	Trigger
Action Node	Action
IF	Filter / Paths
HTTP Request	Webhooks
Credentials	App Connections
Execution	Task
Workflow History	Zap History
AI Agent	AI/Agent features

TASK

AI Content Pipeline

Every day you complete in this internship is another building block in your AI career. Stay curious, stay consistent, and remember: the future belongs to those who keep learning. See you tomorrow don't break the streak!

Every day you complete in this internship is another building block in your AI career. Stay curious, stay consistent, and remember: the future belongs to those who keep learning. See you tomorrow don't break the streak!

TASK MODULES

INTERFACES/TABLES

1. INTERFACE + FORM + TABLE LEAD INTAKE SYSTEM

Scenario

A company wants a simple lead-capture system for its sales team.

Build a **Zapier Interface** containing a lead submission form. Every submitted lead should automatically be stored in a **Zapier Table** and categorized based on the information provided.

What students need to build

Interface

Create a page called:

Sales Lead Intake

Form fields:

- Full Name
- Email
- Phone
- Company
- Industry
- Budget
- Lead Source
- Requirement
- Urgency

Lead Source options:

- Website
- LinkedIn
- Instagram
- Referral
- Advertisement

Urgency:

- Low

Every day you complete in this internship is another building block in your AI career. Stay curious, stay consistent, and remember: the future belongs to those who keep learning. See you tomorrow don't break the streak!

- Medium
- High

Zapier Table

Create a table called:

Leads

Columns:

- Lead ID
- Name
- Email
- Phone
- Company
- Industry
- Budget
- Lead Source
- Requirement
- Urgency
- Lead Score
- Status
- Created At

Default Status:

New

Automation

When the form is submitted:

1. Capture the form data.
2. Calculate a **Lead Score**.
3. Store the complete lead in Zapier Tables.
4. Generate a unique Lead ID.
5. If the lead is high priority, send a notification to the sales team.

Lead scoring example

Students can implement:

- High urgency → +30

Every day you complete in this internship is another building block in your AI career. Stay curious, stay consistent, and remember: the future belongs to those who keep learning. See you tomorrow don't break the streak!

- Medium urgency → +20
- Low urgency → +10
- Budget above \$5,000 → +30
- Budget \$1,000–\$5,000 → +20
- Budget below \$1,000 → +10
- Referral → +20
- LinkedIn → +15

Then:

- 70+ → Hot
- 40–69 → Warm
- Below 40 → Cold

Expected result

A user submits the form:

Ahmad | ABC Company | \$8,000 | LinkedIn | High

Zapier should create something like:

Lead ID: LEAD-2026-001

Score: 75

Status: New

Priority: Hot

Hint

Use:

Interfaces → Zapier Tables → Formatter/Code → Filter/Paths

2. INTERFACE + FORM + TABLE EMPLOYEE EXPENSE APPROVAL

Scenario

Build an internal expense management system where employees submit expenses through a Zapier Interface.

Managers should be able to see the submitted expenses in a Zapier Table and the automation should determine whether the expense requires approval.

Every day you complete in this internship is another building block in your AI career. Stay curious, stay consistent, and remember: the future belongs to those who keep learning. See you tomorrow don't break the streak!

Interface

Create:

Employee Expense Portal

Fields:

- Employee Name
- Employee Email
- Department
- Expense Type
- Amount
- Expense Date
- Description
- Receipt Upload
- Manager Email

Expense Type:

- Travel
- Food
- Software
- Equipment
- Other

Zapier Table

Create:

Expense Requests

Columns:

- Request ID
- Employee
- Department
- Type
- Amount
- Description
- Receipt
- Manager
- Approval Status
- Risk Level

Every day you complete in this internship is another building block in your AI career. Stay curious, stay consistent, and remember: the future belongs to those who keep learning. See you tomorrow don't break the streak!

- Submitted At

Automation logic

When submitted:

1. Generate Request ID.
2. Store request in Table.
3. Determine risk.

Rules:

Low Risk

- Amount < \$100

Medium Risk

- \$100–\$500

High Risk

- \$500

Then:

- Low → Automatically mark "Approved"
- Medium → Send approval request to manager
- High → Send approval request to manager + finance

Extra requirement

If receipt is missing:

Approval Status = "Receipt Required"

Expected workflow

Employee submits:

Software | \$750 | No receipt

System should produce:

Every day you complete in this internship is another building block in your AI career. Stay curious, stay consistent, and remember: the future belongs to those who keep learning. See you tomorrow don't break the streak!

Request: EXP-0045

Risk: High

Status: Receipt Required

Hint

Use:

- Interface Forms
- Tables
- Formatter
- Filter
- Paths
- Email/Slack
- Approval step

CHATBOT

3. AI CUSTOMER SUPPORT BOT

Scenario

Build an AI chatbot for a fictional software company called:

CloudFlow

The chatbot should answer customer questions and collect support requests when it cannot solve the problem.

Chatbot responsibilities

The chatbot should handle:

- Pricing questions
- Product features
- Account questions
- Basic troubleshooting
- Support requests

Knowledge

Give students a small knowledge base containing:

Every day you complete in this internship is another building block in your AI career. Stay curious, stay consistent, and remember: the future belongs to those who keep learning. See you tomorrow don't break the streak!

- Pricing plans
- Features
- Refund policy
- Support hours
- Common troubleshooting solutions

Example:

Starter

\$19/month

Professional

\$49/month

Business

\$149/month

Support:

Monday–Friday, 9 AM–6 PM

Refund:

Customers can request a refund within 14 days.

Important chatbot rule

The bot should NOT invent information.

If it doesn't know the answer:

"I don't have enough information to answer that accurately. I can create a support request for you."

Escalation

If the user says:

"I want to talk to a human."

Collect:

- Name
- Email

Every day you complete in this internship is another building block in your AI career. Stay curious, stay consistent, and remember: the future belongs to those who keep learning. See you tomorrow don't break the streak!

- Problem

Then send the request to a Zapier automation.

Zapier automation

Chatbot → Zapier → Table

Table:

Support Tickets

Columns:

- Ticket ID
- Customer
- Email
- Issue
- Priority
- Status
- Created At

Priority

Detect:

- "System completely down" → Critical
- "Can't access account" → High
- Normal question → Medium
- General request → Low

Hint

Think:

Chatbot → AI → Intent detection → Filter/Path → Table → Notification

4. AI APPOINTMENT BOOKING ASSISTANT

Scenario

Build an AI chatbot for a fictional clinic.

The chatbot should help users book appointments.

Every day you complete in this internship is another building block in your AI career. Stay curious, stay consistent, and remember: the future belongs to those who keep learning. See you tomorrow don't break the streak!

Bot should collect

- Patient Name
- Phone
- Doctor/Specialist
- Preferred Date
- Preferred Time
- Reason for Appointment

Available doctors

- Dr. Ahmed General Physician
- Dr. Sara Dermatologist
- Dr. Ali Cardiologist

Workflow

User:

I want to see Dr. Sara tomorrow at 4 PM.

The chatbot should:

1. Understand the doctor.
2. Convert "tomorrow" into an actual date.
3. Extract time.
4. Check availability.
5. If available → ask for patient details.
6. Create appointment.
7. Confirm booking.

Table

Create:

Appointments

Columns:

- Appointment ID
- Patient
- Phone
- Doctor
- Date

Every day you complete in this internship is another building block in your AI career. Stay curious, stay consistent, and remember: the future belongs to those who keep learning. See you tomorrow don't break the streak!

- Time
- Reason
- Status

If unavailable

The chatbot must NOT book the appointment.

Instead:

"That slot is unavailable. Would you like 3 PM or 5 PM instead?"

Extra challenge

Prevent double booking.

Hint

Use:

Chatbot → AI extraction → Table search → Filter → Create record → Confirmation

KANBAN + FORM AUTOMATION

5. CUSTOMER ONBOARDING PIPELINE

Scenario

Build a CRM-style onboarding system.

A new customer submits an onboarding form. Their record should automatically appear in a Kanban board.

Form

Fields:

- Client Name
- Company
- Email
- Service
- Project Budget
- Start Date

Every day you complete in this internship is another building block in your AI career. Stay curious, stay consistent, and remember: the future belongs to those who keep learning. See you tomorrow don't break the streak!

- Account Manager
- Requirements

Kanban stages

Create:

New Lead → Qualified → Proposal → Won → Onboarding → In Progress → Completed

Automation

When form is submitted:

1. Create customer record.
2. Create Kanban card.
3. Put card into **New Lead**.
4. Assign account manager.
5. Send confirmation email.
6. Add due date.

Stage automation

When card moves:

New Lead → Qualified

Send:

"Lead qualified."

Qualified → Proposal

Create proposal task.

Won → Onboarding

Send onboarding email.

Onboarding → In Progress

Notify project manager.

In Progress → Completed

Every day you complete in this internship is another building block in your AI career. Stay curious, stay consistent, and remember: the future belongs to those who keep learning. See you tomorrow don't break the streak!

Send completion email to customer.

Extra challenge

If a card stays in:

Qualified

for more than 3 days, automatically notify the account manager.

Hint

Use:

Form → Table → Kanban → Paths → Delay → Email

6. RECRUITMENT PIPELINE

Scenario

Build a recruitment management system for a company hiring developers.

Candidates apply through a form and automatically enter a Kanban pipeline.

Form

Fields:

- Candidate Name
- Email
- Phone
- Position
- Experience
- Expected Salary
- Resume
- Portfolio
- Availability

Kanban stages

Applied → Screening → Technical Interview → HR Interview → Offer → Hired → Rejected

Every day you complete in this internship is another building block in your AI career. Stay curious, stay consistent, and remember: the future belongs to those who keep learning. See you tomorrow don't break the streak!

Automation

When application arrives:

1. Create candidate record.
2. Create Kanban card.
3. Analyze experience.
4. Assign priority.
5. Put candidate in Applied.

Priority rules

- 5+ years → High
- 2–4 years → Medium
- <2 years → Low

Stage actions

Applied → Screening

Send screening email.

Screening → Technical Interview

Send interview scheduling email.

Technical Interview → HR Interview

Notify HR.

Offer → Hired

Send congratulations email.

Any stage → Rejected

Send rejection email.

Extra challenge

If a candidate hasn't received an update for 5 days, notify the recruiter.

Every day you complete in this internship is another building block in your AI career. Stay curious, stay consistent, and remember: the future belongs to those who keep learning. See you tomorrow don't break the streak!

Hint

Use:

Forms + Tables + Kanban + Paths + Delay + Email

AUTONOMOUS AGENT

7. AI CUSTOMER SUPPORT RESOLUTION AGENT

Scenario

Build an autonomous support agent that doesn't simply answer questions it decides what action needs to happen.

User submits

"I was charged twice for my subscription."

Agent should determine

Intent:

Billing Issue

Severity:

High

Then decide what to do.

Possible actions

Password problem

→ Send password reset instructions.

Billing question

→ Search customer/order data.

Duplicate payment

→ Create finance ticket.

Technical issue

→ Create technical support ticket.

Every day you complete in this internship is another building block in your AI career. Stay curious, stay consistent, and remember: the future belongs to those who keep learning. See you tomorrow don't break the streak!

Angry/urgent customer

→ Escalate to human.

Tables

Customer Table:

- Customer ID
- Name
- Email
- Plan
- Subscription Status

Ticket Table:

- Ticket ID
- Customer
- Issue
- Category
- Priority
- Action
- Status

Autonomous requirement

The agent decides:

What is the customer's intent?

What data do I need?

Which tool should I use?

Should I answer or escalate?

Extra challenge

The agent should check whether a ticket already exists before creating a duplicate.

Hint

Give the agent tools:

- Search Customer
- Search Tickets
- Create Ticket
- Update Ticket

Every day you complete in this internship is another building block in your AI career. Stay curious, stay consistent, and remember: the future belongs to those who keep learning. See you tomorrow don't break the streak!

- Send Email

8. INSTAGRAM CONTENT AGENT

This one should be your **most interesting agent project**.

Scenario

Build an AI Instagram content agent for a fictional brand.

The goal isn't simply generating captions.

The agent should decide:

What should we post today?

Input

Create a Table:

Content Ideas

Columns:

- Topic
- Product
- Target Audience
- Content Type
- Goal
- Status

Example:

Topic: AI Automation

Product: AI Course

Audience: Business Owners

Content Type: Educational

Goal: Leads

Agent workflow

Every time the agent runs:

Every day you complete in this internship is another building block in your AI career. Stay curious, stay consistent, and remember: the future belongs to those who keep learning. See you tomorrow don't break the streak!

Step 1 Analyze existing content

Check previous Instagram posts.

Determine:

- What topics were already posted?
- What content types are being overused?
- Which topics haven't been covered recently?

Step 2 Choose content

The agent independently chooses:

- Topic
- Hook
- Content type
- CTA
- Target audience

Step 3 Generate post

Generate:

- Instagram caption
- Hook
- CTA
- Hashtags
- Suggested visual concept

Step 4 Quality check

A second AI evaluation should check:

- Is the hook strong?
- Is the content repetitive?
- Is the CTA clear?
- Is it relevant to the audience?
- Does it contain unsupported claims?

If score < 7:

Rewrite

Every day you complete in this internship is another building block in your AI career. Stay curious, stay consistent, and remember: the future belongs to those who keep learning. See you tomorrow don't break the streak!

If score ≥ 7 :

Approve

Step 5 Store

Save the approved post to:

Instagram Content Calendar

Columns:

- Date
- Topic
- Caption
- Hook
- CTA
- Hashtags
- Visual Concept
- Score
- Status

Step 6 Human approval

Do NOT directly publish.

Set:

Status = Awaiting Approval

Then send the content to the marketing person.

Extra autonomous behavior

If there are already 3 educational posts recently, the agent should recognize this and choose another content type.

For example:

Educational → Educational → Educational

Agent decides:

"Too much educational content recently."

Every day you complete in this internship is another building block in your AI career. Stay curious, stay consistent, and remember: the future belongs to those who keep learning. See you tomorrow don't break the streak!

So it chooses:

Case Study

Advanced version

Give the agent access to:

- Instagram post history
- Content Calendar
- Product information
- Customer personas
- Competitor research
- Web search

Now the agent has enough information to make decisions rather than simply following a fixed sequence.

Hint

Think of the architecture as:

Trigger → Agent → Research Tools → Decision → Content Generation → Critic Agent → Decision → Table → Human Approval

9. AI OPERATIONS MANAGER

This can be your **final/master task**.

Scenario

A company wants an AI operations manager that checks business activity every morning and decides what requires attention.

Data sources

Give the agent access to:

Sales Table

- Customer
- Deal
- Amount

Every day you complete in this internship is another building block in your AI career. Stay curious, stay consistent, and remember: the future belongs to those who keep learning. See you tomorrow don't break the streak!

- Stage
- Owner

Tasks Table

- Task
- Owner
- Deadline
- Status

Support Table

- Customer
- Issue
- Priority
- Status

Agent's mission

Every morning, independently analyze the business.

It should determine:

Sales

- Which deals are stuck?
- Which deals need follow-up?
- Which high-value deals need attention?

Tasks

- Which tasks are overdue?
- Who has too many pending tasks?

Support

- Which critical tickets are unresolved?
- Which customers need escalation?

Agent output

Create:

Daily Operations Report

Every day you complete in this internship is another building block in your AI career. Stay curious, stay consistent, and remember: the future belongs to those who keep learning. See you tomorrow don't break the streak!

Example:

HIGH PRIORITY

1. \$12,000 deal hasn't moved for 5 days.
2. Customer XYZ has a critical unresolved ticket.
3. Ahmad has 7 overdue tasks.

RECOMMENDED ACTIONS

- Follow up with XYZ.
- Escalate support ticket.
- Reassign 2 tasks.

Autonomous requirement

The agent should not simply summarize the tables.

It should:

Analyze → Identify problems → Prioritize → Recommend actions → Take permitted actions

For example, if a follow-up is overdue, it can automatically create a follow-up task.

Safety rule

The agent cannot:

- Delete records
- Send external messages without approval
- Change financial information

It can only perform predefined safe actions.

Hint

Architecture:

Schedule → AI Agent → Sales Tool + Task Tool + Support Tool → Reasoning → Action Tool → Report → Human

Every day you complete in this internship is another building block in your AI career. Stay curious, stay consistent, and remember: the future belongs to those who keep learning. See you tomorrow don't break the streak!
